

Claims

What is claimed is:

1. Lamination apparatus to make lamination layers with a laminate film pasted on the surfaces of such printed matters as posters, advertising fliers and computer output, comprising:

a means to measure the length of the laminate film drawn out of the original roll,

a means to input the whole length of the roll of laminate film,

a means to subtract the measured values of drawn out the laminate film from the length of the original roll,

a display system to indicate such subtracted values, and

an alarm system to issue a warning in case that such subtracted value reaches the designated level or less.

2. Lamination apparatus containing the speed control system to give slow start and slow stop to the motor which drives the carry roller in order to convey such printed matters as posters, advertising fliers and computer output media passing in layers with the laminating film through the space between pressure roller and itself.
